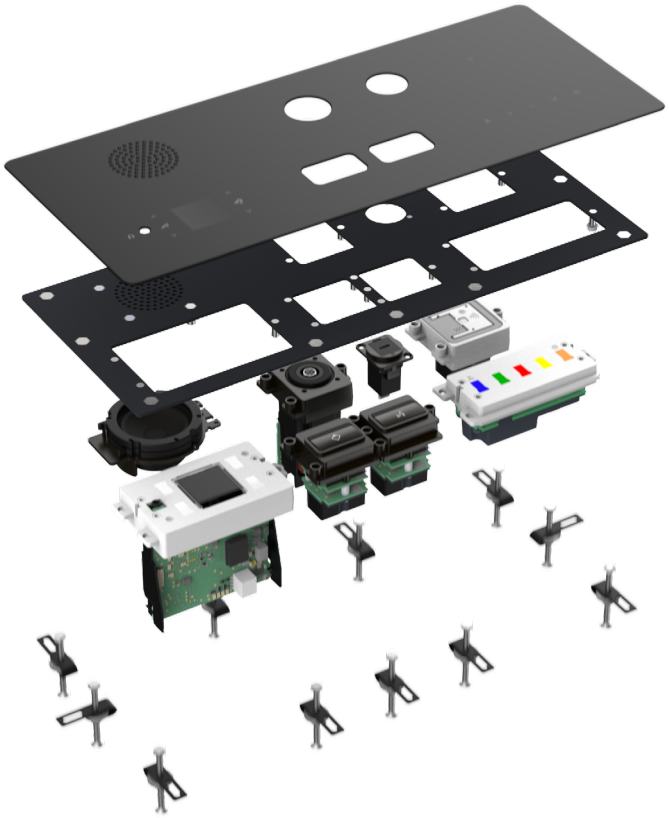
Custom Dimension adds further flexibility to

DICENTIS Flush

New bespoke service allows parliaments and councils to upgrade their systems without altering their furniture

The highly customizable DICENTIS Flush range has been expanded to offer a solution to an even wider range of users. DICENTIS Flush – Custom Dimension has been created as a flexible conference system that can be built to meet the unique needs of customers in historic buildings, such as councils and parliaments. It offers a tailored approach where customers can get the modern functionality of a state-of-the-art conference system in a made-to-measure package that will fit existing spaces.



Made to your requirements

A challenge faced by many parliaments and councils is the restrictions placed on the adaption of their physical infrastructure. Many conference rooms feature historic furniture that would need to be altered if a new conference system is permanently installed. DICENTIS Flush – Custom Dimension overcomes this issue as it is made to the exact dimensions specified by the end customer.
In the case of a solution upgrade, DICENTIS Flush – Custom Dimension can be built to fit the same footprint of the previous system. This ensures the customer can receive an improved meeting environment without further altering their furniture.

Defining dimensions

To ensure maximum flexibility for installations, end customers are able to specify the width and height of new DICENTIS Flush – Custom Dimension devices. This will ensure a precise fit into any piece of furniture while giving users modern functionality where they need it.

Flush functionality

DICENTIS Flush – Custom Dimension provides the opportunity to choose the layout of the conference device. This includes elements such as placement for the microphone, language selector, voting buttons, loudspeaker, microphone button, USB feed through connector and ID reader.
The solution offers all of the same functionality and modules as the rest of the DICENTIS Flush family. This adds even more flexibility to end customers as they are able to create a system that meets their needs for functionality while ensuring that it fits perfectly in the available space.
